

Globecomm[®] Maritime's Nimbus[™]

Fully-Loaded Maritime Communications

Unlock the Potential—Stay in Control

A scalable platform solution to your complex communication needs.

Advanced functionality for next generation connectivity.

Builds on Globecomm's pedigree of innovative value-added solutions.

Complete neutrality with maximum flexibility.

Powerful and Flexible

Nimbus from Globecommm Maritime offers shipowners, managers, officers and crew a powerful and cost-effective management platform for communications worldwide. Nimbus manages connections to all major IP-based satellite and 3G/4G networks to deliver broadband data and value-added applications wherever vessels trade.

Nimbus is a complete solution that is modular in design and can be configured to match the customer's priorities, from essential voice and data communication to advanced services for crew welfare and vessel management. Users are free to choose connection types, terminals, services and bandwidth to meet their cost and performance needs.

Reflecting the trend towards more complex shipboard networks and new satellite service introductions, Nimbus is designed to simplify ship and shore-based communications by enabling users to choose the applications and levels of user control that suit them best.

As the bandwidth available to maritime users increases, Nimbus provides the means to permit officers and crew to access a greater range of value added and third party applications, while enabling the owner to retain a practical level of control. Use VOIP, web apps and specialist

software like Globecomm's AccessChat to stay in touch while removing the administration burden and managing bandwidth.

Optimized, Simplified Connectivity

Key functionality includes optimization, compression and caching for improved web browsing, a built-in email server enabling use of any email client, embedded PayPal for pre-pay crew access. Caching can be extended to antivirus and program updates which can be stored locally and Nimbus can be custom-configured to enable the integration of third party and bespoke software programmes.

To help superintendents manage network settings by vessel or across a fleet, Globecomm provides a secure web portal, Cirrus for ship, and shoreside users alike. Functionality includes selecting preferred satellite connectivity and redundancy, configuring user accounts, establishing firewall rules and managing updates.

Nimbus features a high capacity disk on which applications are embedded, providing a single, powerful shipboard operating system. Nimbus enables connections via multiple WAN inputs with automatic switching for fail over and the security that critical messages will be delivered.

Nimbus Key Features

- Compatible with all IP-based satellite and 3G/4G networks
- Compression, caching and optimization for improved internet browsing
- Built-in email server allows connection to corporate or webmail services
- Custom module supports integration of third party and customer-specific programs
- Complete visibility, control and accountability across networks and devices from ship and shore
- Supports next generation of crew communications with embedded PayPal and credit card authorisation

Nimbus Key Benefits

Flexibility. Supports the customer's choice of connectivity and applications, auto-switching for stable 'smart routing' between channels.

Functionality. Complete policy and user access control ensures delivery of high priority messages, multiple LANs for business, crew, charterer and M2M applications, detailed reporting for all users.

Future-proofing. Designed for the maritime environment, compatible with Current IP-based and next generation maritime communications systems, and supports BYOD.

Freedom. Enterprise users can use third party, bespoke or web applications, all staff can use their own email accounts. Embedded pre-pay means zero administration for company or the ship's master.
